HBM
weights and
parameters
read once per launch
weights (URAM),
six layers;
parameters
HBM
windows in,
bits out
activations:
two buffers,
128 channels, 8 bit
convolution engine
64 × 16 weight block,
1024 products per cycle,
one site per cycle
partial sums: 64 channels
× all sites, 32 bit
epilogue: bias,
requantize, GELU
table, or threshold
to bits
next layer
or output bits
